

### 13.Arrow Function(Alternate for normal function Syntax)

- Until now we have used the old function syntax
- But in ES6 we had some changes in syntax
- We can use arrow function in react

```
src > .js App.js > App > [e] expenses
1  import Expenses from './components'
2
3
4  function App() {
5    const expenses = [
6      {title: 'Current Bill',
7       amount: 432,
8       date: new Date(2022, 3, 23)},
9    ]
10  }
```

```
src > .js App.js > ...
1  import Expenses from './components'
2
3
4  const App = () => {
5    const expenses = [
6      {title: 'Current Bill',
7       amount: 432,
8       date: new Date(2022, 3, 23)},
9    ]
10  }
```

- - This works
  - Most react developers prefer arrow functions
