4. Adding css and classname to elements

- Let us create a css file for expenseitem component

-
  - We are creating the .css file adjacent to that component itself

```
import './ExpenseItem.css'

function ExpenseItem() {
  return (
    <div className='expense-item'>
      <div>13 March 2022</div>
      <div className='expense-item__description' >
        <h2>Car insurance</h2>
        <div className='expense-item__price' >$234.59</div>
      </div>
    </div>
  );
}

export default ExpenseItem;
```

  - **Here we are importing the css file**
  - **And we don't use class=" loke we would use in normal html, because it is jsx syntax, in js we already have class keyword so for adding styling classes to jsx elements we use className**

-
